

M&G Global Corporate Bond Fund - Euro Class A-H

Fund Factsheet as at 31 October 2018

Fund description

The fund aims to deliver income and capital growth by investing at least 70% of the fund in investment grade (high quality) fixed income securities issued by companies from anywhere in the world. Up to 20% of the fund may also be invested in other global fixed income investments. The fund holds these assets directly and through derivatives. The fund manager's overall economic outlook will determine the portfolio's overall positioning, while an in-house team of independent credit analysts assists in the selection of individual bond issues.

Risks associated with this fund

For any past performance shown, please note that past performance is not a guide to future performance.

The value of investments and the income from them will rise and fall. This will cause the fund price, as well as any income paid by the fund, to fall as well as rise. There is no guarantee the fund will achieve its objective, and you may not get back the amount you originally invested.

The fund may use derivatives with the aim of profiting from a rise or a fall in the value of an asset (for example, a company's bonds). However, if the asset's value varies in a different manner, the fund may incur a loss.

Changes in currency exchange rates will affect the value of your investment.

The value of the fund may fall if the issuer of a fixed income security held is unable to pay income payments or repay its debt (known as a default).

Further risk factors that apply to the fund can be found in the fund's Key Investor Information Document (KIID).

Single year performance (5 years)

From To	01.11.17 31.10.18	01.11.16 31.10.17	01.11.15 31.10.16	01.11.14 31.10.15	01.11.13 31.10.14
Fund	-5,1%	3,1%	5,8%	-0,8%	5,8%
Annual performance 2017: 3,9%					

Performance over 5 years

Past performance is not a guide to future performance.

Hedged share classes aim to mirror the performance of another share class. We cannot guarantee that the hedging objective will be achieved. The hedging strategy will limit holders of the hedged share class from benefiting if the hedged share class currency falls against the Euro. Please note that this fund comes with further risks that are explained in the Key Investor Information Document.

Things you should know

The fund allows for the extensive use of derivatives.

Key information

Fund manager	Ben Lord
Fund manager tenure from	5 September 2013
Deputy fund manager	Wolfgang Bauer
Launch date	5 September 2013
Launch of share class	5 September 2013
Fund size (millions)	€21,11
Fund type	OEIC, incorporated in the UK
Comparative sector	Morningstar Global Corporate Bond - EUR Hedged sector
Number of issuers	60
Modified duration (years)	5,5
Distribution yield (Acc)	2,36%
Distribution yield (Inc)	3,55%
Underlying yield (Acc)	2,36%
Underlying yield (Inc)	2,36%
Volatility¹	3,77%
Average credit rating	BBB+
Share type	Acc & Inc

¹Source: Morningstar, three-year annualised volatility, as at 31 October 2018

The distribution yield reflects the amounts that may be expected to be distributed over the next 12 months as a percentage of the share price, as at the date shown. It is based on a snapshot of the portfolio on that day. It does not include any preliminary charge and investors may be subject to tax on distributions. It is the fund's policy to offset certain charges against income for accumulation share classes and to offset certain charges against capital for income share classes. These charges include the annual management charge, administration fee and share class hedging fee (where applicable). As a result, yield figures for income and accumulation share classes may differ significantly. The underlying yield reflects the annualised income net of expenses of the fund (calculated in accordance with relevant accounting standards) as a percentage of the mid-market price of the fund as at the date shown. It is based on a snapshot of the portfolio on that day. It does not include any preliminary charge and investors may be subject to tax on distributions. For the fund's income share classes, the distribution yield is higher than the underlying yield only because a portion of the fund's expenses are charged to capital. This has the effect of increasing distribution(s) for the year and constraining the fund's capital performance to an equivalent extent.

Please see the glossary for an explanation of terms used.

No rating	1,5	3,2
Cash	1,8	1,8

The portfolio holds 5,9 % of non investment grade corporate bonds (rated BB and below).
Where a security has not been rated by Standard & Poor's, Fitch or Moody's, we may use M&G's internal credit rating. Based on a comparison of all available ratings for each security, the most conservative rating (S&P, Fitch, Moody's or M&G's internal rating) is taken into consideration. The ratings so identified are then expressed or converted into M&G's ratings format to obtain uniform information for all securities in the portfolio.

This glossary provides an explanation of terms used in this factsheet and in our literature.

Asset: Anything having commercial or exchange value that is owned by a business, institution or individual.

Asset class: Category of assets, such as cash, company shares, fixed income securities and their sub-categories, as well as tangible assets such as real estate.

Bond: A loan in the form of a security, usually issued by a government or company, which normally pays a fixed rate of interest over a given time period, at the end of which the initial amount borrowed is repaid.

Capital: Refers to the financial assets, or resources, that a company has to fund its business operations.

Capitalisation: The total market value of all of a company's outstanding shares.

Convertible bonds: Fixed income securities that can be exchanged for predetermined amounts of company shares at certain times during their life.

Corporate bonds: Fixed income securities issued by a company. They are also known as bonds and can offer higher interest payments than bonds issued by governments as they are often considered more risky.

Credit: The borrowing capacity of an individual, company or government. More narrowly, the term is often used as a synonym for fixed income securities issued by companies.

Credit Default Swaps (CDS): Are a type of derivative, namely financial instruments whose value, and price, are dependent on one or more underlying assets. CDS are insurance-like contracts that allow investors to transfer the risk of a fixed income security defaulting to another investor.

Credit rating: An independent assessment of a borrower's ability to repay its debts. A high rating indicates that the credit rating agency considers the issuer to be at low risk of default; likewise, a low rating indicates high risk of default. Standard & Poor's, Fitch and Moody's are the three most prominent credit rating agencies. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of security's life.

Credit spread: The difference between the yield of a corporate bond, a fixed income security issued by a company, and a government bond of the same life span. Yield refers to the income received from an investment and is expressed as a percentage of the investment's current market value, and a bond is a fixed income security.

Default: When a borrower does not maintain interest payments or repay the amount borrowed when due.

Derivatives: Financial instruments whose value, and price, are dependent on one or more underlying assets. Derivatives can be used to gain exposure to, or to help protect against, expected changes in the value of the underlying investments. Derivatives may be traded on a regulated exchange or traded over the counter.

Developed economy / market: Well-established economies with a high degree of industrialisation, standard of living and security.

Dividend: Dividends represent a share in the profits of the company and are paid out to a company's shareholders at set times of the year.

Duration: A measure of the sensitivity of a fixed income security, also called a bond, or bond fund to changes in interest rates. The longer a bond or bond fund's duration, the more sensitive it is to interest rate movements.

Emerging economy or market: Economies in the process of rapid growth and increasing industrialisation. Investments in emerging markets are generally considered to be riskier than those in developed markets.

Episode: A phase during which investors allow their emotions to affect their decision making, which can cause financial markets to move irrationally.

Equities: Shares of ownership in a company.

Exposure: The proportion of a fund invested in a particular share/fixed income security, sector/region, usually expressed as a percentage of the overall portfolio.

Fixed income security: A loan in the form of a security, usually issued by a government or company, which normally pays a fixed rate of interest over a given time period, at the end of which the initial amount borrowed is repaid.

Floating rate notes (FRNs): Securities whose interest (income) payments are periodically adjusted depending on the change in a reference interest rate.

Gilts: Fixed income securities issued by the UK government.

Government bonds: Fixed income securities issued by governments, that normally pay a fixed rate of interest over a given time period, at the end of which the initial investment is repaid.

Hard currency (bonds): Refers to bonds denominated in a highly traded, relatively stable international currency, rather than in the bond issuer's local currency. Bonds issued in a more stable hard currency, such as the US dollar, can be more attractive to investors where there are concerns that the local currency could lose value over time, eroding the value of bonds and their income.

Hedging: A method of reducing unnecessary or unintended risk.

High yield bonds: Fixed income securities issued by companies with a low credit rating from a recognised credit rating agency. They are considered to be at higher risk of default than better quality, ie higher-rated fixed income securities but have the potential for higher rewards. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of security's life.

Index: An index represents a particular market or a portion of it, serving as a performance indicator for that market.

Index-linked bonds: Fixed income securities where both the value of the loan and the interest payments are adjusted in line with inflation over the life of the security. Also referred to as inflation-linked bonds.

Inflation: The rate of increase in the cost of living. Inflation is usually quoted as an annual percentage, comparing the average price this month with the same month a year earlier.

Investment grade bonds: Fixed income securities issued by a company with a medium or high credit rating from a recognised credit rating agency. They are considered to be at lower risk from default than those issued by companies with lower credit ratings. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of a security's life.

Issuer: An entity that sells securities, such as fixed income securities and company shares.

Leverage: When referring to a company, leverage is the level of a company's debt in relation to its assets. A company with significantly more debt than capital is considered to be leveraged. It can also refer to a fund that borrows money or uses derivatives to magnify an investment position.

Liquidity: A company is considered highly liquid if it has plenty of cash at its disposal. A company's shares are considered highly liquid if they can be easily bought or sold since large amounts are regularly traded.

Local currency (bonds): Refers to bonds denominated in the currency of the issuer's country, rather than in a highly traded international currency, such as the US dollar. The value of local currency bonds tends to fluctuate more than bonds issued in a hard currency, as these currencies tend to be less stable.

Long position: Refers to ownership of a security held in the expectation that the security will rise in value.

Macroeconomic: Refers to the performance and behaviour of an economy at the regional or national level. Macroeconomic factors such as economic output, unemployment, inflation and investment are key indicators of economic performance. Sometimes abbreviated to 'macro'.

Maturity: The length of time until the initial investment amount of a fixed income security is due to be repaid to the holder of the security.

Modified duration: A measure of the sensitivity of a fixed income security, called a bond, or bond fund to changes in interest rates. The longer a bond or bond fund's duration, the more sensitive it is to interest rate movements.

Monetary policy: A central bank's regulation of money in circulation and interest rates.

Near cash: Deposits or investments with similar characteristics to cash.

Net: The proportion of a fund invested in, for example, different sectors. Derivatives are included. The latter are financial instruments whose value, and price, are dependent on one or more underlying assets.

Net Asset Value (NAV): A fund's net asset value is calculated by taking the current value of the fund's assets and subtracting its liabilities.

Open-Ended Investment Company (OEIC): A type of managed fund, whose value is directly linked to the value of the fund's underlying investments.

Options: Financial contracts that offer the right, but not the obligation, to buy or sell an asset at a given price on or before a given date in the future.

Overweight: If a fund is 'overweight' a stock, it holds a larger proportion of that stock than the comparable index or sector.

Physical: The fund's exposure excluding derivatives, which are financial instruments whose value, and price, is dependent on one or more underlying securities.

Retail Prices Index (RPI): A UK inflation index that measures the rate of change of prices for a basket of goods and services in the UK, including mortgage payments and council tax.

Securitise / Securitisation: The creation and issuance of tradable securities, such as bonds, that are backed by the income generated by an illiquid asset or group of assets. By pooling a collection of illiquid assets, such as mortgages, securities backed by the mortgages' income payments can be packaged and sold to a wider range of investors.

Short position: A way for a fund manager to express his or her view that the market might fall in value.

Short-dated corporate bonds: Fixed income securities issued by companies and repaid over relatively short periods.

Short-dated government bonds: Fixed income securities issued by governments and repaid over relatively short periods.

Swap: A swap is a derivative contract where two parties agree to exchange separate streams of cashflows. A common type of swap is an interest rate swap to hedge against interest rate risk.

Synthetic inflation-linked bonds: Refers to securities created using a combination of assets to simulate the characteristics of inflation-linked bonds. By buying inflation-linked government bonds and selling protection against companies defaulting on their debts, using credit default swaps, the combined synthetic investment will behave similarly to a physical inflation-linked bond, had one had been issued. Synthetic inflation-linked bonds are usually created where a company does not have any inflation-linked bonds in issue.

Total return: The term for the gain or loss derived from an investment over a particular period. Total return includes income (in the form of interest or dividend payments) and capital gains.

Valuation: The worth of an asset or company based on its current price.

Volatility: The degree to which a given security, fund, or index rapidly changes. It is calculated as the degree of deviation from the norm for that type of investment over a given time period. The higher the volatility, the riskier the security tends to be.

Yield: This refers to either the interest received from a fixed income security or to the dividends received from a share. It is usually expressed as a percentage based on the investment's costs, its current market value or its face value. Dividends represent a share in the profits of a company and are paid out to the company's shareholders at set times of the year.
