Report of the Directors of AXA Fixed Interest Investment ICVC

AXA Fixed Interest Investment ICVC ("the Company") is an investment company with variable capital incorporated in England and Wales and authorised by the Financial Conduct Authority ("FCA").

Shareholders are not liable for the debts of the Company.

There are eight sub-funds which are currently available in the Company (each a "Fund"), and in the future there may be other sub-funds in the Company.

Each Fund has the investment powers equivalent to those of a UCITS (Undertakings for Collective Investment in Transferrable Securities) under the FCA's Collective Investment Schemes Sourcebook ("COLL"). The Funds are segregated portfolios of assets and, accordingly, the assets of a Fund belong exclusively to that Fund and shall not be used or made available to discharge (directly or indirectly) the liabilities of, or claims against, any other person or body, including the Company and any other Fund, and shall not be available for any such purpose. Further details in relation to the segregated nature of the Funds can be found in the Prospectus.

AXA Global Short Duration Bond Fund has a holding of 6,300,000 shares in US Short Duration High Yield Fund with a market value of £8,662,500, there are no other cross holdings.

Important Events During the Year

During the period from 1st July 2018 to 31st December 2018 the following change to the Prospectus took place:

Compulsory conversion of net share or unit classes

With effect from 6 April 2017, HMRC introduced tax rule changes which required the Funds to pay all interest distributions gross without any deduction for tax. As a result, there is no longer any need for there to be net paying share/unit classes in the Fund. Therefore on the 12th October 2018 (the "Conversion Date"), the net paying shares or units converted into the existing gross paying share or unit class.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide long-term high income combined with any capital growth.

Investment Policy

The Fund invests primarily in a diversified portfolio of high yield bonds issued by companies anywhere in the world. The fund manager focuses on credit analysis to create a portfolio of bonds that seeks diversification across companies showing improving resilience against default. The Fund is managed with reference to the composition and risk profile of the BofA Merrill Lynch Global High Yield Index. However the fund manager invests on a discretionary basis with a significant degree of freedom to take positions which are different from the index.

Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a Fund which invests primarily in fixed interest stocks you are likely to be looking for an investment which will generate an income but has less potential for capital return than is the case with Funds which invest primarily in equities. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. You are aware that investing in a Fund which has a global remit can increase risk because of currency movements in return for greater potential reward. However, the Fund is hedged back to sterling. You are also aware that investing in sub investment grade bonds increases the potential income but also increases risk to your investment. Typically you would be investing for a period of at least five years.

| Lower Risk | | | | Higher Ris | | | |
|----------------------|------|---|---|------------|-------|-----------------------|--|
| Potentially lower re | ward | | | | Poter | ntially higher reward | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings). See further below under "High yield bonds risk".

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• High yield bonds risk - high yield bonds (also known as sub-investment grade bonds) are fixed interest securities issued by companies or governments with lower credit ratings (Ba1 and below (Moody's) or BB+ and below (Standard & Poor's and Fitch Ratings)). They are potentially more risky than investment grade bonds which have higher ratings. The issuers of high yield bonds will be at greater risk of default or ratings downgrades. The capital value of a Fund's investment in high yield bonds and the level of income it receives may fall as a result of such issuers ceasing to trade. A Fund will endeavour to mitigate the risks associated with high yield bonds, by diversifying their holdings by issuer, industry and credit quality.

This is an inherent risk for funds invested within high yield bonds. Internal investment guidelines (which may include measures of credit quality, measures of sensitivity to credit spread moves and diversification measures), scenario testing as well as other regular monitoring seek to ensure the level of risk is aligned with each individual fund's investment objectives and investment policy.

• Interest rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

Other risks which could have an impact in extreme market conditions include:

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that fund liquidity will meet the fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk - (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Investment Review

A number of macro headwinds were carried from the first half of 2018 in to the second. The US Federal Reserve (Fed) continued a central bank tightening cycle and the European Central Bank (ECB) ended quantitative easing (QE) on schedule. US President Trump toned down trade disputes with the North American Free Trade Agreement (NAFTA) and Europe but continued to ratchet up and down concerns with China; meanwhile, Italy disputed its budget with Brussels. The German economy slowed significantly in the second half as car production was affected by environmental law changes, although the broad slowdown across Europe does suggest that the slowdown in the Chinese economy is having a larger impact than, perhaps, anticipated. Of course, Brexit continued to rubble on unresolved in the background.

By the year-end, signs of slower growth in the euro area and China have combined to reduce confidence that the US economy would be able to sustain growth once the impact of fiscal stimulus had faded. With ongoing trade tensions, a more conflicted US political situation since the mid-term elections and a rapidly declining oil price financial markets began rapidly pricing in a much worse economic environment for 2019.

Against this background, H2 2018 became increasingly challenging for global high yield. In Q3, the Fund's much greater weight in US dollar assets was an advantage. US equity markets remained strong and high yield trends followed with CCCs and weaker names continuing the outperformance of H1 2018.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

However, after a relatively benign period in the third quarter, this all began to reverse in Q4 as the macro trends discussed began to have greater impact and risk assets generally began to sell off, led by equities and oil. After being a top-performing sector for the first three quarters of the year, the energy sector experienced a significant sell-off to finish the year, returning -9.77% during the quarter and -6.37% for 2018. Healthcare and telecommunications maintained their lead and outperformed in 2018. Q4 also witnessed a significant rise in idiosyncratic risk, particularly in Europe. Across October and November, several names were subject to negative headlines and experienced a significant drop in bond prices. Retail globally has consistently been a difficult area for market generally and results here continued to be mixed, with spreads moving quite sharply wider.

US high yield as measured by ICE BofAML Global High Yield Index, which had outperformed well though the first three quarters, suffered the worst quarterly return since third quarter of 2015, and the seventh-worst return over the last 20 years. In the absence of a 70 basis points (bps) market rally during the last three days of the year, this quarter's return would have been the worst since the third quarter of 2011.

Over the period in review, the Fund generated a total net return of -2.82% (Z Acc, net of fees) and -2.55% (Z Acc, gross of fees), while its comparative benchmark, the ICE BofAML Global High Yield Index delivered a return of -2.03% (GBP hedged).

Looking at regions, the ICE BofAML US High Yield Index returned -3.2%, behind Europe as the ICE BofAML European Currency High Yield Index returned -1.4%; meanwhile, emerging markets somewhat recovered from the lows at +0.8% as measured by the ICE BofAML High Yield US Emerging Markets Corporate Plus Index (all index returns are hedged to GBP).

For the full-year 2018, the Fund generated a total net return of -3.63% (Z Acc, net of fees and gross of tax) and -3.10% (Z Acc, gross of fees), while its comparative benchmark, the ICE BofAML Global High Yield Index delivered a return of -3.59% (GBP hedged).

The Fund's outperformance - versus its comparative benchmark through 2018 - can be largely explained by the performance in the fourth quarter where the overweight position in short duration, particularly in the US but also in Europe, proved defensive. Positioning in the energy sector was also key, specifically the underweight exposure to the oilfield services sub-sector, which was down 14% in H2 2018. Our underweight position in emerging markets, which protected the Fund so well in Q2 2018, was a negative in Q4 as emerging markets held up reasonably well against other high yielding fixed income. We did take some credit hits, including Sanchez Energy, which cost 20bps, and Nystar (mining) in Europe which cost 5bps. We have exited these positions. Rackspace and Riteaid cost 15bps and 10bps respectively, although we have maintained these positions.

After the significant repricing last year, valuations in global high yield are now looking particularly attractive. With the ICE BofAML Global High Yield Index now yielding around 8%, valuations are now at levels not seen since mid-2016 after the collapse of oil prices. Given the attractive levels of carry that the asset class is offering, there is a greater yield premium available to provide a cushion against any potential spread widening.

As we begin the new year, markets are being driven by the macro outlook. The increase in volatility reflects uncertainty on growth in the major economies. However, it can be argued that many of the typical conditions for a recession are not in place and there is the possibility that markets have become too pessimistic. Therefore, we acknowledge that there is the potential for further volatility in high yield, either driven by macro headlines or idiosyncratic stories. However, with fundamentals broadly robust and default rates forecast to stay contained, we believe there is reason for optimism over high yield in 2019.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide income combined with any capital growth.

Investment Policy

The Fund invests predominantly in a diversified portfolio of bonds (including index-linked bonds) issued by companies and governments globally (including in emerging markets) where the period for full repayment of the bond by the company or government is expected to be less than 5 years. The Fund aims to reduce the effect of fluctuations in interest rates and the frequency and magnitude of market movements while generating income.

The Fund may invest up to 60% in high yield bonds. The fund manager seeks to reduce the effect of credit risk through diversification and its analysis and selection of bonds. Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets).

The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

| Lower Risk | | | Higher Ris | | | |
|----------------------|-------|---|------------|---|-------|-----------------------|
| Potentially lower re | eward | | | | Poter | ntially higher reward |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is based on simulated performance or performance of funds of this type and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to low levels of variation under normal market conditions but which may still result in losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings). See further below under "High yield bonds risk".

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Interest rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

• Index-linked bonds risk - index-linked bonds are fixed interest securities whose capital repayment amounts and interest payments are adjusted in line with movements in inflation indices. They are designed to mitigate the effects of inflation on the value of a portfolio. The market value of index-linked bonds is determined by the market's expectations of future movements in both interest rates and inflation rates.

As with other bonds, the value of index-linked bonds will generally fall when expectations of interest rates rise and vice versa. However, when the market anticipates a rise in inflation rates, index-linked bonds will generally outperform other bonds, and vice versa.

Index-linked bonds bought in the secondary market (i.e., not directly from the issuer) whose capital values have been adjusted upward due to inflation since issuance, may decline in value if there is a subsequent period of deflation.

Due to the sensitivity of these bonds to interest rates and expectations of future inflation, there is no guarantee that the value of these bonds will correlate with inflation rates in the short to medium term.

• High yield bonds risk - high yield bonds (also known as sub-investment grade bonds) are fixed interest securities issued by companies or governments with lower credit ratings (Ba1 and below (Moody's) or BB+ and below (Standard & Poor's and Fitch Ratings)). They are potentially more risky than investment grade bonds which have higher ratings. The issuers of high yield bonds will be at greater risk of default or ratings downgrades. The capital value of a Fund's investment in high yield bonds and the level of income it receives may fall as a result of such issuers ceasing to trade. A Fund will endeavour to mitigate the risks associated with high yield bonds, by diversifying their holdings by issuer, industry and credit quality.

This is an inherent risk for funds invested within high yield bonds. Internal investment guidelines (which may include measures of credit quality, measures of sensitivity to credit spread moves and diversification measures), scenario testing as well as other regular monitoring seek to ensure the level of risk is aligned with each individual fund's investment objectives and investment policy.

• Risks linked to investment in sovereign debt - the Funds may invest in bonds issued by countries and governments (sovereign debt). The governmental entity that controls the repayment of sovereign debt may not be able or willing to repay the capital and/or interest when due in accordance with the terms of such debt. In such a scenario, the value of investments of the Funds may be adversely affected. A governmental entity's willingness or ability to repay capital and interest due in a timely manner may be affected by, among other factors, its cash flow situation, the extent of its foreign currency reserves, the availability of sufficient foreign exchange on the date a payment is due, the relative size of the debt service burden to the economy as a whole, the governmental entity's policy towards the International Monetary Fund and the political constraints to which a governmental entity may be subject. Governmental entities may also be dependent on expected disbursements from foreign governments, multilateral agencies and others abroad to reduce principal and interest on their debt. In addition, there are no bankruptcy proceedings for such issuers under which money to pay the debt obligations may be collected in whole or in part. Holders may be requested to participate in the rescheduling of such sovereign debt and to extend further loans to the issuers.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Certain countries are especially large debtors to commercial banks and foreign governments. Investment in sovereign debt issued or guaranteed by such countries (or their governments or governmental entities) involves a higher degree of risk than investment in other sovereign debt.

Certain Funds may be further subject to the risk of high concentration in bonds issued by and/or guaranteed by a single sovereign issuer which is below investment grade and/or unrated which is also subject to higher credit risk. In the event of a default of the sovereign issuer, a Fund may suffer significant loss.

This is an inherent risk for funds invested within sovereign bonds. Internal investment guidelines, scenario testing as well as other regular monitoring seek to ensure the level of risk is aligned with each individual fund's investment objectives and investment policy.

• Emerging Markets risk - investment in emerging markets may involve a higher risk than those inherent in established markets. Emerging markets and their currencies may experience unpredictable and dramatic fluctuations from time to time. Investors should consider whether or not investment in such Funds is either suitable for or should constitute a substantial part of an investor's portfolio.

Companies in emerging markets may not be subject to:

a. accounting, auditing and financial reporting standards, practices and disclosure requirements comparable to those applicable to companies in major markets;

b. the same level of government supervision and regulation of markets as countries with more advanced securities markets.

Accordingly, certain emerging markets may not afford the same level of investor protection as would apply in more developed jurisdictions.

Restrictions on foreign investment in emerging markets may preclude investment in certain securities by the Funds referred to above and, as a result, limit investment opportunities for those Funds. Substantial government involvement in, and influence on, the economy, as well as a lack of political or social stability, may affect the value of securities in certain emerging markets.

The reliability of trading and settlement systems in some emerging markets may not be equal to that available in more developed markets, which may result in delays in realising investments.

Lack of liquidity and efficiency in certain emerging markets may mean that from time to time the ACD may experience more difficulty in purchasing or selling holdings of securities than it would in a more developed market.

This is an inherent risk for funds invested within Emerging Markets. Internal investment guidelines (such a diversification measures), scenario testing as well as other regular monitoring seek to ensure the level of risk is aligned with each individual fund's investment objectives and investment policy.

Other risks which could have an impact in extreme market conditions include:

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that fund liquidity will meet the fund's expected liquidity requirements.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Main Snapshot

The six months to December 2018 saw the main central banks withdrawing or discussing the withdrawal of liquidity and continuing to tighten monetary conditions. Concerns over global growth, trade relations, and uncertainty in the US and around Brexit all contributed to poor performance. Investment grade credit markets out-performed emerging markets and high yield during the period with US high yield being the top under-performer following its sharp sell-off in December.

Corporate bond markets began the period positively, with credit spreads (the difference in yield between corporate bonds and their equivalent government-issued bonds) tightening in July. This was supported by a positive US and European earnings season, limited primary issuance and receding trade war fears, as European Commission President Juncker and US President Trump successfully met to discuss reducing tariffs. August saw credit spreads widen, mostly caused by escalating trade tensions between the US and China and turmoil in emerging markets (especially in Turkey and Argentina). Spreads were also under renewed pressure after the Italian government set out a higher-than-anticipated deficit target for the next three years. Despite the continuation of these themes in September, spreads mostly tightened on the back of strong US economic data at the end of the third quarter. US treasury, German bund and UK gilt yields rose in the third quarter, with the yield on the 10-year US treasury reaching 3.2% in early October, as the Bank of England (BoE) raised the interest rate by 0.25% to 0.75% in August and the US Federal Reserve (Fed) by also 0.25% to 2.00%-2.25% in September. The surge in the oil price, with Brent climbing to a four-year high in September, also put upward pressure on yields over this period.

Credit spreads widened throughout the fourth quarter due to a combination of a disappointing outlook for corporate earnings, fears of a moderation in global growth, rising US interest rate expectations and continued trade tensions between the US and China. Europe was further affected by rising tensions between the EU and Italy over the Italian budget, and the EU and the UK over Brexit. More positively, in December, the Italian government offered to cut its budget deficit projection in a bid to find a compromise with the EU. The fourth quarter saw a fall in US treasury, German bund and UK gilt yields due to the risk-off environment and heightened Brexit concerns. The European Central Bank (ECB) ceased its monthly bond-purchasing programme in December and kept interest rates unchanged, as widely expected. The Fed raised its benchmark interest rate, once again, by 0.25% to 2.25-2.50%, as expected, but failed to deliver the anticipated dovish hike, weighing negatively on sentiment. Prime Minister Theresa May postponed the parliamentary vote on her draft agreement with the EU in December, increasing the likelihood of a 'no-deal' Brexit.

Fund activity

Activity was high over the period, retaining a bias towards investment grade with a preference for the US dollar and sterling credit markets. The Fund invested inflows across a range of names. New additions to the Fund included US transportation company Ryder and US bank Associated Bank in dollars, South African financial services group Investec and German carmaker Daimler in sterling, and Italian utility Terna and US conglomerate General Electric in euros. Over the period, with nominal government bonds offering limited value, we retained our preference for short-dated (having less than five years to redemption) US Treasury Inflation Protected Securities (TIPS).

Despite improving valuations, we remained cautious on high yield and emerging markets (favouring the latter) during the period. Following the large sell-off in emerging markets in August, we increased our exposure to it in September, buying Colombian energy company Ecopetrol and UAE bank Union National Bank, both denominated in dollars and new additions to the Fund. As a consequence of the sharp under-performance of euro high yield in November, we also added some exposure to it in December, buying bonds from French services company Loxam and French media company Banijay, both being denominated in euros and new additions to the Fund.

Fund performance and outlook

The Fund returned -0.38% (Z Acc, net of fees and gross of tax) for the six months to 31 December 2018.

Despite 2018 being the worst year on record since 2008 for most credit markets, the value proposition in global fixed income markets remains limited. This is in light of further withdrawals of liquidity by the Fed and ECB, fears of slowing global economic growth, continuing trade tensions, increased risk of a 'no-deal' Brexit and renewed political risk in the European periphery (non-core).

The sharp increase in the number of negative 'idiosyncratic' events this year is more than just 'noise' and should continue as it is directly linked to the gradual tightening of monetary conditions, leading to an outlook of higher volatility and sharper asset repricing.

Given this backdrop, we maintain a defensive bias within the Fund with a higher allocation to investment grade, to allow us to add gradually to high yield and emerging markets at better levels.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide income combined with any capital growth.

Investment Policy

The Fund invests primarily in a diversified portfolio of investment grade bonds issued by companies. The Fund manager seeks to reduce the effect of credit risk through its analysis and selection of bonds (with a particular emphasis on industry and issuer) and also positions the Fund to take advantage of the Fund manager's expectation of interest rate movements. The Fund is managed with reference to the composition and risk profile of the ICE BofAML Sterling Corporate Index. However the Fund manager invests on a discretionary basis with a significant degree of freedom to take positions which are different from the index. In particular, the Fund should demonstrate lower sensitivity to movements in market interest rates than the index.

Where bonds are denominated in a currency other than sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a fund which invests primarily in fixed interest stocks you are likely to be looking for an investment which will generate an income but has less potential for capital return than is the case with funds which invest primarily in equities. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. Typically, you would prefer an investment with less risk than that of a fund which invests significantly in equities or overseas. Typically, you would be investing for a period of at least five years.

| Lower Risk | | | | Higher Ris | | | |
|----------------------|------|---|---|------------|-------|-----------------------|--|
| Potentially lower re | ward | | | | Poter | ntially higher reward | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings).

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Interest Rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

Other risks which could have an impact in extreme market conditions include:

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that Fund liquidity will meet the Fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy.

Investment Review

Brexit has been a key feature for the UK as the 29 March 2019 deadline for the UK withdrawal approaches. In July, Prime Minister Theresa May convinced her cabinet to agree on a softer Brexit approach, but some high-profile pro-Brexit cabinet members resigned as a result. A further watered down version was later approved in parliament. A solution to the Irish border issue that satisfied both sides continued to be the sticking point, so a 'no-deal' Brexit remained a concern, and Bank Governor Carney acknowledged a wide range of possible outcomes on Brexit talks. Positive rumours about the outcome of Brexit negotiations became a reality in November when the PM was at last able to announce a Brexit Withdrawal Agreement (WA) with the EU, following an apparent solution to the Irish border issue. This compromise WA, however, was condemned by both 'Remain' and 'Leave' camps, and criticism about the Irish backstop forced Theresa May to abandon the Brexit vote in parliament in December. She later fended off a belated vote of no-confidence in her leadership of the Conservative party after promising not to lead the party into the 2022 general election. The EU insists there is no room for further negotiation, with both sides stepping up plans for worst-case 'no-deal' Brexit. That, or no Brexit may yet force MPs to vote for the current compromise deal.

As expected, the Bank of England raised rates by 25 basis points (bps) to 0.75% in early August in order to achieve its inflation target, despite Brexit uncertainty and acknowledging softer global growth with evidence of trade tensions. Further rate hikes would be limited and gradual; the Bank expected one hike of 25bps in each of the next two years, based on forecasts that assume a smooth Brexit. This had increased to one hike in each of the next three years, by the time of November's Quarterly Inflation Report, with the UK's output gap expected to be closed from late 2019.

Tariffs previously mooted became a reality. In July, US tariffs on \$34 billion of Chinese imports began, China retaliated, with the US considering, then implementing (in August) tariffs on \$16 billion more. US President Trump met with European Commission's Juncker and agreed on a ceasefire in their trade war, aiming to work towards zero tariffs. US officials suggested that China will be a longer-term problem, but believed its aggressive stance made sense, with the strength of the US economy cushioning any problems. In September, the US imposed 10% tariffs - set to rise to 25% from January - on a further \$200 billion of Chinese imports, with China again retaliating. Following December's G20 meeting, the US and China announced a 90-day ceasefire in their trade war, postponing January's scheduled hike in tariffs.

Investment Manager's Report For the six months ended 31 December 2018 (unaudited)

US monetary policy has followed the path expected, the US Federal Reserve (Fed) raising rates by 25bps in September and December (now at a 2.25-2.50% target range), as the firm economy outweighed trade tensions and the resulting higher import costs. The Fed's view on rates has softened dramatically, with Fed Chairman Powell suggesting US rates were just below neutral in November, only weeks after saying they were well below neutral – maybe that was the impact of tighter financials conditions following weakness in risk markets. In Europe, the European Central Bank (ECB) acknowledged that the uncertainty around trade was a risk but remained confident that strengthening domestic demand will provide protection from an externally-led slowdown. Its bond purchase programme would stop, as planned, at the end of 2018.

Macro concerns in emerging markets (EM) resurfaced in August, causing extreme currency weakness for Argentina and Turkey and stress in their bond markets. This affected fund flows, but wholesale contagion was avoided. Italy was another worry for markets over the summer on fears that the new government's budget would breach EU deficit limits. A breach was avoided, but September's budget deficit announcement was above what had been touted by the previous regime and rejected by the EU. Negotiations found a middle ground and the budget was agreed in December. Equity markets were firm over the summer, but turned sharply weaker in October, perhaps reflecting that the best period in the economic cycle has passed, impacted by higher government bond yields (in the US in particular), which had been in an upward trend for over 12 months. It may be the case that US dollar cash yielding 2%+ is now a viable risk-free investment, reducing the attraction of more risky assets. Government bond yields fell as investors sought a safe haven from weak equities. Softening growth, partly tariff related, prompted China to cut rates. The growth backdrop was becoming more of a concern.

New issuance of sterling corporate bonds was typically guiet over the summer, but picked up in September and October, including some subordinated deals on relatively wide spreads. The general risk-off environment curtailed further activity. Corporate bonds were particularly under pressure in November with an increase in the number of negative corporate-related headlines including: further deterioration in sentiment in the company GE, risks of bans of certain tobacco products, financial misconduct claims against the chairman of Renault, and an aborted takeover of shopping centre group Intu. Corporate bonds remained soft in December, and new issuance ground to a halt. Corporate bonds spreads were 24bps higher (adjusted for +8bps index rebalancing) at +178bps over the period. In addition to spread, returns from corporate bonds are also based on the move in underlying gilt yields, which traded higher over the summer, before reversing on safe haven flows as risk assets wobbled and the Fed turned more dovish. With little change in gilt yields, corporate bond yields were 30bps higher at 3.01%, to give a total return on the ICE BofAML Sterling Corporates & Collateralised Index of -0.43%, with 0-5 years +0.13%, 5-15 years +0.05% and Over 15 years -1.36%. By rating band, moves were as to be expected in a more risk-averse environment, with lower rated bonds underperforming: BBB's widened the most (+47bps to 227bps), A's +20bps to +153bps (although part of the difference between these two rating bands reflected GE's downgrade from A to BBB), while AAA and AA rated bond spreads were 14bps and 12bps wider at +50bps and +81bps respectively. All sectors saw wider spreads, with higher quality sectors such as healthcare, services (which includes many universities) and quasi-government holding up relatively well with spreads between 9bps and 15bps wider, while consumer goods (includes tobacco), automotive and subordinated financials (both banks and insurers) were between 41bps and 56bps wider. Capital goods was the clear loser, however, with spreads 107bps wider as GE, a significant corporate borrower, disappointed markets and was downgraded to BBB from A.

The AXA Sterling Corporate Bond Fund provided a total return of -0.66% (Z Acc, net of fees and gross of tax) during the six months to 31 December 2018.

Most of the Fund's purchases were new issues, some of which were from debutant borrowers in the sterling market. New issues participated in included: Toyota, the AA, Goldman Sachs, Investec Bank, Connect Plus (M25 motorway operator), Daimler, Santander, Quadgas, DP World, Vodafone, Prudential, CenterParcs and Legal & General. To take advantage of wider spreads, we added bonds in the secondary market from Yorkshire Building Society (switching out of shorter YBS bonds), Hammerson, Hiscox, GE and AB InBev. Many holdings were top sliced to fund acquisitions, with exposure to Unilever, Digital Realty, John Lewis, Hastings and Kennedy Wilson Europe exited fully. There was little change to the Fund's duration positioning.

Higher US rates, US balance sheet reduction, the wind down of ECB quantitative easing (QE) and trade tariffs (and slower Chinese growth) among other things, have dented growth sentiment going into 2019, in stark contrast to confidence in synchronised global growth 12 months earlier. That said, only tariffs were not anticipated. Resultant flatter yields curves, weak equity and corporate bond markets have sowed doubt about previous higher rates expectations, prompting lower government bond yields. Tighter policy to date has been measured and slow, and largely in the US, with most commentators only expecting slower growth, not recession. The Fed may pause in its rate hiking cycle, taking note of markets' caution, but still expects to hike 25bp twice in 2019, although markets are pricing out any further hikes. The Chinese have plenty of tools to offset their slowdown in growth. Trade talks between the US and China could prove key: Should the situation worsen, there will be further pressure on growth and risk assets underpinning expectations of at least unchanged, if not looser, monetary policy. If resolved, this would provide a boost for growth with central banks' reappraising their caution on monetary policy.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

While a slowing growth environment is less supportive for company profits, the widening of corporate bond spreads from their tightest (i.e. most expensive) levels in January 2018 represents a decent cheapening in value, which should be viewed as attractive should economic growth prospects stabilise or improve. Any deterioration in the macro backdrop would likely see further weakness. Government bond yields would likely benefit (fall) from any further deterioration in sentiment, but would reverse higher on an improvement. Corporate bond spreads would likely move in the opposite direction. Individual credit stories have been on the increase, often without warning, illustrating the advantage of owning a diversified portfolio of credits.

Brexit will have a significant impact on the UK economy with interest rate and gilt yield implications. The WA negotiated by the government has many opponents, so finding a common ground that will get sufficient support is a massive challenge. Loyalty among political parties is not a given, with the subject so divisive. A softer Brexit would appear to be the best hope of gaining support of the opposition parties as well as being least damaging from an economic perspective (apart from no Brexit) for the UK. Such an approach, however, is at odds with Theresa May's insistence on no permanent customs union with the EU (as this would limit the UK's ability to negotiate trade deals with other countries), along with ending the free movement of people. Only hard-line Brexiteers appear keen for the UK to leave the EU with no deal given the dire economic projections; however, risk remains that we reach a 'no-deal' outcome by accident, being unable to agree on anything else. An extension of Article 50 to allow further negotiations (even if the EU insists there is nothing more that can be done) may offer some hope. The outcome is far from clear: May's deal, a softer Brexit, hard Brexit, no Brexit, a second referendum, a general election (would either of the two main parties campaign for a second referendum – they suggest not).

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide income combined with any capital growth.

Investment Policy

The Fund invests primarily in a diversified portfolio of investment grade bonds issued by companies where the period for full repayment of the bond by the company is expected to be less than 5 years with the aim of reducing the effect of fluctuations in interest rates. The fund manager seeks to reduce the effect of credit risk through diversification and its analysis and selection of bonds.

Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a Fund which invests primarily in fixed interest stocks you are likely to be looking for an investment, which will generate an income but has less potential for capital return than is the case with Funds which invest primarily in equities. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. Typically, you would prefer an investment with less risk than that of a Fund which invests significantly in equities or overseas. Typically, you would be investing for a period of at least five years.

| Lower Risk Higher | | | | | | Higher Risk |
|--|---|---|---|---|---------------------------|-------------|
| Potentially lower reward Potentially higher reward | | | | | Potentially higher reward | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to low levels of variation under normal market conditions but which may still result in losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings).

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Interest rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

Other risks which could have an impact in extreme market conditions include:

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that fund liquidity will meet the fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Main snapshot

The sterling corporate bond market delivered slightly negative returns for the six months to 31 December 2018.

Corporate bond markets began the period positively, with credit spreads (the difference in yield between corporate bonds and their equivalent government-issued bonds) tightening in July and remaining range-bound in August. This was supported by a positive US and European earnings season, limited primary issuance and receding trade war fears, as European Commission President Juncker and US President Trump successfully met to discuss reducing tariffs. September saw credit spreads widen, mostly caused by heavy supply, escalating trade tensions between the US and China, and heightened worries about inconclusive Brexit negotiations. Spreads were also under renewed pressure during this period after the Italian government set out a higher-than-anticipated deficit target for the next three years. Despite Brexit negotiations reaching an 'impasse', gilt yields largely rose in the third quarter, reaching a high of 1.7% in early October, as the Bank of England (BoE) raised the interest rate by 0.25% to 0.75% in August and the US Federal Reserve (Fed) by also 0.25% to 2.00%-2.25% in September.

Credit spreads continued to widen throughout the fourth quarter due to a combination of a disappointing outlook for corporate earnings, fears of a moderation in global growth, rising US interest rate expectations and continued trade tensions between the US and China. Europe was further affected by rising tensions between the EU and Italy over the Italian budget, and the EU and the UK over Brexit. More positively, in December, the Italian government offered to cut its budget deficit projection in a bid to find a compromise with the EU. The fourth quarter saw a fall in gilt yields due to the risk-off environment and heightened Brexit concerns, despite wages growing in October at 3.1% in the three months to August, the highest rate of growth recorded for almost 10 years. The European Central Bank (ECB) ceased its monthly bond-purchasing programme in December and kept interest rates unchanged, as widely expected. The Fed raised its benchmark interest rate, once again, by 0.25% to 2.25-2.50%, as expected, but failed to deliver the anticipated dovish hike, weighing negatively on sentiment. Prime Minister Theresa May postponed the parliamentary vote on her draft agreement with the EU in December, increasing the likelihood of a 'no-deal' Brexit.

Fund activity

In terms of the Fund's activity, we were active over the period investing across a range of names and sectors in order to keep the Fund in line with our active strategies, with a bias towards low-volatility names and defensive sectors.

We invested in names including Toyota (Japanese carmaker), CBA (Australian bank) and General Electric (US conglomerate). New additions to the Fund included Morrisons (UK retailer), EDF (French utility) and Investec (South African financial services group).

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

September was the busiest month in the period in terms of new issues at £8.2 billion, the busiest month since September 2016, but was mostly biased towards new deals with more than a 10-year maturity. Factors including seasonality and the risk-off environment saw sterling investment grade primary issuance collapse to £300 million in December. We were also generally active in the secondary market (existing debt traded between investors) over the period.

Fund performance and outlook

The AXA Sterling Credit Short Duration Bond Fund generated a total return of -0.25% (Z Acc, net of fees and gross of tax) over the six months to December.

Despite 2018 being only the second year in the last 20 years in which the broad sterling credit market recorded a loss for the full year, the value proposition in the sterling credit market remains limited. This is in light of further withdrawals of liquidity by the Fed and ECB, fears of slowing global economic growth, continuing trade tensions, increased risk of a 'no-deal' Brexit and renewed political risk in the European periphery (non-core).

The sharp increase in the number of negative 'idiosyncratic' events this year is more than just 'noise' and should continue as it is directly linked to the gradual tightening of monetary conditions, leading to an outlook of higher volatility and sharper asset repricing.

Given this backdrop, we maintain a defensive bias to allow us to benefit from potential pockets of weaknesses ahead.

AXA Sterling Index-Linked Bond Fund

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide income and capital growth, with the objective of reducing the negative effect of inflation over the long term.

Investment Policy

The Fund invests primarily in a portfolio of index-linked bonds issued by the UK government. The fund manager also seeks to increase performance of the Fund by investing in non-governmental, non-index-linked, and non-Sterling denominated bonds where these offer better value. The Fund is managed with reference to the composition and risk profile of the FTSE Actuaries UK Index-Linked Gilts Over 5 Years Index. However the fund manager invests on a discretionary basis with a significant degree of freedom to take positions which are different from the index.

Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a Fund which invests primarily in index-linked fixed interest stocks you are likely to be looking for an investment which will generate a steady and predictable income whilst providing some protection against inflation. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. Typically, you would prefer an investment with less risk than that of a Fund which invests significantly in equities or overseas and you would be investing for a period of at least five years.

| Lower Risk | Risk Higher | | | | Higher Risk | |
|--|-------------|---|---|---|-------------|---|
| Potentially lower reward Potentially higher reward | | | | | | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Interest rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

AXA Sterling Index-Linked Bond Fund

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Index-linked bonds risk - are fixed interest securities whose capital repayment amounts and interest payments are adjusted in line with movements in inflation indices. They are designed to mitigate the effects of inflation on the value of a portfolio. The market value of index-linked bonds is determined by the market's expectations of future movements in both interest rates and inflation rates.

As with other bonds, the value of index-linked bonds will generally fall when expectations of interest rates rise and vice versa. However, when the market anticipates a rise in inflation rates, index-linked bonds will generally outperform other bonds, and vice versa.

Index-linked bonds bought in the secondary market (i.e., not directly from the issuer) whose capital values have been adjusted upward due to inflation since issuance, may decline in value if there is a subsequent period of deflation.

Due to the sensitivity of these bonds to interest rates and expectations of future inflation, there is no guarantee that the value of these bonds will correlate with inflation rates in the short to medium term.

Other risks which could have an impact in extreme market conditions include:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings).

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Main Snapshot

Over the six months to December, the UK's rate of inflation remained at similar levels, initially rising from 2.4% in June to 2.7% in August, before falling to 2.3% in November. Slower price rises in the areas of transport, recreation and culture (among other factors) were behind the lower rate. Lower oil prices fed into the lower transport rate, although rising tobacco prices mitigated this influence on the overall rate.

Prime Minister Theresa May faced intensifying pressure after presenting a Brexit deal that was criticised by both the 'Leave' and 'Remain' camps. On 15 November, two senior Cabinet members (including the Brexit secretary Dominic Raab) resigned. Stock markets retreated, while UK gilts gained. On 10 December, the prime minister postponed a parliamentary vote on her deal, which had been scheduled for the following day, after it became evident that the deal still lacked support.

Growth in the UK services sector sagged to a seven-month low in November as Brexit fears lingered. More positively, growth in the UK economy picked up pace, with GDP expanding 0.6% from the third quarter. This was an improvement on the previous quarter, in which the economy grew by 0.4%. In addition, retail sales in November were ahead of expectations; month-on-month sales increased by 1.4%, buoyed by strong sales in household goods.

The Bank of England's (BoE) Monetary Policy Committee raised interest rates by 25 basis points (bps) in August to 0.75% citing the ongoing tightening in the labour market and wage pressures, while they maintained interest rates at that level through to the end of Q4 2018.

Meanwhile, following the presentation of Autumn budget from the Chancellor of the Exchequer, the Debt Management Office (DMO) announced a reduction in the amount of issuance of nominal and index linked Gilts for the remainder of the current fiscal year 2018/19.

Inflation expectations for the next year were higher, according to the BoE's most recent survey. The survey of the British public showed that respondents expected inflation to be 3.2% in one year (up from the previous figure of 3.0%). When asked about inflation in the longer term, those surveyed felt that inflation would be 3.5% in five years' time.

In Europe, performance between core and peripheral bonds diverged early in Q4. Italian inflation-linked bonds came under pressure following Moody's rating downgrade and ongoing tensions with the European commission around Italy's budget. Euro breakevens underperformed in this 'risk-off' environment, posting negative returns in October and November before recovering somewhat in December, as Italian bonds recovered after the Italian government resubmitted an improved budget more in line with EU demands.

The US Federal Reserve (Fed) also raised its benchmark interest rate to 2.25–2.50% in December but lowered its rate-hike projections for 2019 from three to two, as well as its growth forecasts for both 2018 and 2019. US Treasury Inflation-Protected Securities' (TIPS) breakevens narrowed in H2 2018, driven by lower energy oil prices and weaker risk sentiment.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Fund Activity

Over the period, we maintained an overweight portfolio duration (a measure of the sensitivity of a bond's price to a change in interest rates) exposure relative to the comparative benchmark (the FTSE-Actuaries Index-Linked 5+ Years Index). At the start of H2 2018, we retained a preference for longer-dated bonds over shorter-dated bonds. The market fully expected a rate rise from the BoE in August after persistent climbs in inflation. As expected, the BoE raised interest rates and the UK Consumer Price Index rate of inflation came in slightly higher at 2.5%.

In September, we started to reduce longer-dated bonds, as the inflation breakeven (the difference in yield between a nominal bond and an inflation-linked bond) widened over the month. UK government bonds outperformed other core government bonds in October, although UK inflation breakevens initially widened, but ended unchanged as they weakened in line with weak risk markets.

November saw poor returns largely driven by the weakness in the long end of the nominal gilt yield, which had an adverse impact given the long duration nature of the portfolio, although this was offset by higher inflation breakevens as Brexit concerns weighed on sterling. Developed government bond markets benefited from a flight to quality in December as equity and risk markets sold off into the year-end. The long end of the curve reversed much of its previous month's underperformance, which benefited the Fund given the long duration nature of the portfolio, and more than offset a narrowing in breakeven spreads.

Fund performance and outlook

During the six months ending 31 December 2018, the AXA Sterling Index Linked Bond Fund provided a total net return of 0.47% (Z Acc, net of fees and gross of tax), compared with the FTSE A UK Govt Index-Linked 5 Years+ Index return of 0.62%. In comparison, the US and European Inflation linked Government bond index returned a -1.43% and -1.98% respectively, while the Global Inflation Linked Government Index returned a -0.92%.

Global developed-government bond markets should continue to benefit from any further global risk aversion and concerns about the outlook for global growth. More locally, for the gilt and UK index-linked market, Brexit developments will remain the focus and will likely be the main driver of near-term relative Fund performance.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide an income and capital return (net of fees) in line with the market for sterling denominated, investment grade bonds issued by companies over the long-term while maintaining a low turnover of bonds held by the Fund. The market is represented by the ICE BofAML Sterling Non-Gilt Index for long-term performance purposes.

Investment Policy

The average credit quality and sensitivity to movements in market interest rates of the bonds held by the Fund are very similar to those of the bonds represented by the index but otherwise the Fund manager has complete discretion to take positions which are different from the Index in seeking to achieve the Fund's objective. The Fund invests at least 70% of its value in sterling denominated, investment grade bonds issued by companies and may also invest up to 20% of its value in non-sterling denominated, investment grade bonds. The low turnover manner in which the Fund is managed means that the Fund avoids unnecessary trading costs. The fund manager focuses on avoiding downgrades and defaults through its analysis and selection of bonds and, by diversifying the Fund's portfolio across different corporate sectors, aims to mitigate the risks associated with any particular sector. Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM). The Fund is permitted to use derivatives for investment purposes but does not currently do so.

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a Fund which invests primarily in fixed interest stocks you are likely to be looking for an investment which will generate an income but has less potential for capital return than is the case with funds which invest primarily in equities. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. Typically, you would prefer an investment with less risk than that of a fund which invests significantly in equities or overseas. Typically, you would be investing for a period of at least five years.

| Lower Risk | | | | | | Higher Risk |
|----------------------|------|---|---|---|-------|-----------------------|
| Potentially lower re | ward | | | | Poter | ntially higher reward |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings).

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• Interest Rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

Other risks which could have an impact in extreme market conditions include:

• Prepayment and extension risk- prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that fund liquidity will meet the fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds Sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Market Snapshot

The sterling bond market delivered slightly negative returns for the six months to 31 December 2018. Yields fluctuated over the period on the back of the risk-off environment and an increased likelihood of a 'no-deal' Brexit, changing market sentiment and renewed political risk in the European periphery.

The Fund slightly outperformed its comparative benchmark over the period, returning -0.23% (Z Acc, net of fees and gross of tax) against the return of the broad sterling credit universe of -0.30%, as measured by the ICE BofAML Sterling Non-Gilt Index.

The portfolio suffered from volatility and a backup in yield in Q3 and Q4, due to an increase in UK interest rates.

The Bank of England (BoE) raised interest rates in Q3 to 0.75%, as expected, and kept this unchanged in Q4. The third quarter also saw GDP grow 0.6% quarter-on-quarter, marking the best growth for seven quarters. As such, the BoE raised its GDP forecast for 2018 from 1.4% to 1.5%, and for 2018 from 1.7% to 1.8%.

The benchmark 10-year government bond yield fell over Q4, moving from 1.57% at the start of October to 1.28% by December's close. UK government bonds took their cue from US peers, which rallied due to concerns over slowing growth and later fears of a US government shutdown.

The US treasury yield fell over Q4, moving from 3.06% at the start of October to 2.68% by December's close. In December, the US Federal Reserve raised interest rates to a range of 2.25–2.50%, a move that was widely expected by investors.

In Europe, the Italian government announced its first budget, in which public spending (as a percentage of GDP) looked set to increase beyond EU limits. Despite receiving a formal objection from the EU, Italy initially continued with its plans, and received a credit rating downgrade from Moody's. However, in December, it emerged that the Italian government had succumbed to EU demands. Italian 10-year bonds, which had been elevated above 3% during October, November and early December, fell in response, ending the year at 2.74%. German yields, meanwhile, moved from 0.47% to 0.24% over the quarter.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Fund Activity

A number of new names were added to the portfolio in the six months to 31 December. In Q3, we added Italian utility company Enel, as well as a new securitization through the new A+ rated deal from Connect Plus M25. In Q4, we participated in Southern Housing Association sterling deal and Anglian Water's long-dated issue.

We were quite cautiously positioned over 2018 but, as the market experiences some weakness, we will reinvest natural cash flows benefiting from repricing into sectors such as autos, energy and real estate. Non-sterling investments are starting to look attractive again and the primary market will be the preferred choice to incrementally add back overseas exposure.

Outlook

With ongoing trade tensions and a more conflicted US political situation since the mid-term elections, financial markets have rapidly priced in a much worse economic environment for 2019. Markets are now pricing in a cut in the federal funds rate in 2020, after no additional hikes this year.

As we begin the new year, markets are driving the macro outlook. The increase in volatility reflects uncertainty about growth in the major economies. However, it can be argued that many of the typical conditions for a recession are not in place, and there is the possibility that markets have become too pessimistic. As such, the widening of credit spreads to levels last seen in the 2015 growth scare may present an opportunity for fixed income investors in the months ahead.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide an income combined with any capital growth over the long-term.

Investment Policy

The Fund invests primarily in a diversified portfolio of sterling-denominated, investment grade bonds issued by companies and governments. The Fund manager seeks to reduce the effect of credit risk through its analysis and selection of bonds (with a particular emphasis on industry and issuer) and also positions the Fund to take advantage of its expectation of interest rate movements. The Fund is managed with reference to the composition and risk profile of the BofA Merrill Lynch Sterling Broad Market Index. However the Fund manager invests on a discretionary basis with a significant degree of freedom to take positions which are different from the index.

Where bonds are denominated in a currency other than Sterling, the Fund aims to reduce the risk of movements in exchange rates between such currency and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

| Lower Risk | | Higher Ris | | | | |
|---------------------|--------|------------|---|---|-------|-----------------------|
| Potentially lower r | reward | | | | Poter | ntially higher reward |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings).

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

• Interest rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

Other risks which could have an impact in extreme market conditions include:

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that Fund liquidity will meet the Fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy.

Investment Review

Brexit has been a key feature for the UK as the 29 March 2019 deadline for the UK withdrawal approaches. In July, Prime Minister Theresa May convinced her cabinet to agree on a softer Brexit approach, but some high-profile pro-Brexit cabinet members resigned as a result. A further watered-down version was later approved in parliament. A solution to the Irish border issue that satisfied both sides continued to be the sticking point, so a 'no-deal' Brexit remained a concern, and Bank Governor Carney acknowledged a wide range of possible outcomes on Brexit talks. Positive rumours about the outcome of Brexit negotiations became a reality in November when the PM was, at last, able to announce a Brexit Withdrawal Agreement (WA) with the EU, following an apparent solution to the Irish border issue. This compromise WA, however, was condemned by both 'Remain' and 'Leave' camps, and criticism about the Irish backstop forced Theresa May to abandon the Brexit vote in parliament in December. She later fended off a belated vote of no-confidence in her leadership of the Conservative party after promising not to lead the party into the 2022 general election. The EU insists there is no room for further negotiation, with both sides stepping up plans for worst-case 'no-deal' Brexit. That, or no Brexit may yet force MPs to vote for the current compromise deal.

As expected, the Bank of England raised rates by 25 basis points (bps) to 0.75% in early August in order to achieve its inflation target, despite Brexit uncertainty and acknowledging softer global growth with evidence of trade tensions. Further rate hikes would be limited and gradual; the Bank expected one hike of 25bps in each of the next two years, based on forecasts that assume a smooth Brexit. This had increased to one hike in each of the next three years, by the time of November's Quarterly Inflation Report, with the UK's output gap expected to be closed from late 2019.

Tariffs previously mooted became a reality. In July, US tariffs on \$34 billion of Chinese imports began, China retaliated, with the US considering, then implementing (in August) tariffs on \$16 billion more. US President Trump met with European Commission's Juncker and agreed on a ceasefire in their trade war, aiming to work towards zero tariffs. US officials suggested that China will be a longer-term problem, but believed its aggressive stance made sense, with the strength of the US economy cushioning any problems. In September, the US imposed 10% tariffs - set to rise to 25% from January - on a further \$200 billion of Chinese imports, with China again retaliating. Following December's G20 meeting, the US and China announced a 90-day ceasefire in their trade war, postponing January's scheduled hike in tariffs.

US monetary policy has followed the path expected, the US Federal Reserve (Fed) raising rates by 25bps in September and December (now at a 2.25-2.50% target range), as the firm economy outweighed trade tensions and the resulting higher import costs. The Fed's view on rates has softened dramatically, with Fed Chair Powell suggesting US rates were just below neutral in November, only weeks after saying they were well below neutral – maybe that was the impact of tighter financials conditions following weakness in risk markets. In Europe, the European Central Bank (ECB) acknowledged that the uncertainty around trade was a risk, but remained confident that strengthening domestic demand will provide protection from an externally-led slowdown. Its bond purchase programme would stop, as planned, at the end of 2018.

Investment Manager's Report For the six months ended 31 December 2018 (unaudited)

Macro concerns in emerging markets (EM) resurfaced in August, causing extreme currency weakness for Argentina and Turkey and stress in their bond markets. This affected fund flows, but wholesale contagion was avoided. Italy was another worry for markets over the summer on fears that the new government's budget would breach EU deficit limits. A breach was avoided, but September's budget deficit announcement was above what had been touted by the previous regime and rejected by the EU. Negotiations found a middle ground and the budget was agreed in December. Equity markets were firm over the summer, but turned sharply weaker in October, perhaps reflecting that the best period in the economic cycle has passed, impacted by higher government bond yields (in the US in particular), which had been in an upward trend for over 12 months. It may be the case that US dollar cash yielding 2%+ is now a viable risk-free investment, reducing the attraction of more risky assets. Government bond yields fell as investors sought a safe haven from weak equities. Softening growth, partly tariff-related, prompted China to cut rates. The growth backdrop was becoming more of a concern.

Gilt yields trended higher over the summer ahead of the UK rate hike, with occasional reversals on EM/Italian budget/trade/Brexit concerns. Post-Brexit referendum highs were hit in October, as gilts followed US treasury yields higher in response to strong US economic data and optimism on a Brexit deal. Sharply weaker equities and Italian budget concerns pushed yields lower on safe haven demand, partially reversing as these abated. Increasingly negative idiosyncratic corporate stories saw US treasury yields tumble from their early November peak, further boosted by a more dovish Fed outlook. Coupled with the compromise Brexit WA that disappointed the optimists, gilt yields followed suit. Ten-year gilt yields fell 14bps to 1.28% (adjusted for benchmark change which added 14bps to the 10-year yield) over the latest six months, having peaked at 1.73% in October. Thirty-year gilt yields were 8bps higher at 1.82%. The ICE BofAML Gilt Index produced a total return of +0.21%, with 0-5 years +0.50%, 5-15 years +1.57% and over 15 years -0.81%.

New issuance of sterling corporate bonds was typically quiet over the summer, but picked up in September and October, including some subordinated deals on relatively wide spreads. The general risk-off environment curtailed further activity. Corporate bonds were particularly under pressure in November with an increase in the number of negative corporate-related headlines and remained soft in December, with new issuance grinding to a halt. Corporate bonds spreads were 214bps higher (adjusted for +6bps index rebalancing) at +151bps over the period. With little change in gilt yields, corporate bond yields were 27bps higher at 2.72%, to give a total return on the ICE BofAML Sterling Non-Gilts Index of -0.30%. By rating band, moves were as to be expected in a more risk-averse environment, with lower-rated bonds underperforming: BBB's widened the most (+47bps to 227bps), A's +20bps to +153bps (although part of the difference between these two rating bands reflected GE's downgrade from A to BBB), while AAA and AA rated bond spreads were 14bps and 12bps wider to +50bps and +81bps respectively. All sectors saw wider spreads, but capital goods was the standout loser with spreads 107bps wider as GE, a significant corporate borrower, disappointed markets and was downgraded to BBB from A. The ICE BofAML Sterling Broad Index rose 0.04% over the period.

The AXA Sterling Strategic Bond Fund provided a total return of -0.61% (Z Acc, net of fees and gross of tax) during the six months to 31 December 2018.

The Fund follows a UK aggregate strategy, giving investors exposure to gilts and investment grade corporate bonds (including high quality quasi-government bonds). The fund has favoured a small overweight in corporate bonds, encouraged extra yield in a global lowyield environment and relatively supportive credit fundamentals, with an underweight position in lower yielding gilts as a consequence. Our caution that yields would trend higher as central banks pursued tighter monetary policies has seen the Fund adopt a small short duration position relative to the index, in order to reduce the negative price impact from such a move. The extent of the short duration was reduced after gilt yields rose in the summer. The Fund bought some new corporate bond issues including: the AA, Goldman Sachs, Investec Bank, Connect Plus (M25 motorway operator), Daimler, Santander, Quadgas, DP World, Vodafone, Prudential, CenterParcs and Legal & General. Many holdings were top sliced to fund acquisitions, with exposure to Unilever and Kennedy Wilson Europe exited fully.

Higher US rates, US balance sheet reduction, the wind down of ECB quantitative easing (QE) and trade tariffs (and slower Chinese growth) among other things, have dented growth sentiment going into 2019, in stark contrast to confidence in synchronised global growth 12 months earlier. That said, only tariffs were not anticipated. Resultant flatter yields curves, weak equity and corporate bond markets have sowed doubt about previous higher rates expectations, prompting lower government bond yields. Tighter policy to date has been measured and slow, and largely in the US, with most commentators only expecting slower growth, not recession. The Fed may pause in its rate hiking cycle, taking note of markets' caution, but still expects to hike 25bps twice in 2019, although markets are pricing out any further hikes. The Chinese have plenty of tools to offset their slowdown in growth. Trade talks between the US and China could prove key: Should the situation worsen, there will be further pressure on growth and risk assets underpinning expectations of at least unchanged, if not looser, monetary policy. If resolved, this would provide a boost for growth with central banks' reappraising their caution on monetary policy.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

While a slowing growth environment is less supportive for company profits, the widening of corporate bond spreads from their tightest (i.e. most expensive) levels in January 2018 represents a decent cheapening in value, which should be viewed as attractive should economic growth prospects stabilise or improve. Any deterioration in the macro backdrop would likely see further weakness. Government bond yields would likely benefit (fall) from any further deterioration in sentiment, but would reverse higher on an improvement. Corporate bond spreads would likely move in the opposite direction. Individual credit stories have been on the increase, often without warning, illustrating the advantage of owning a diversified portfolio of credits.

Brexit will have a significant impact on the UK economy with interest rate and gilt yield implications. The WA negotiated by the government has many opponents, so finding a common ground that will get sufficient support is a massive challenge. Loyalty among political parties is not a given, with the subject so divisive. A softer Brexit would appear to be the best hope of gaining support of the opposition parties as well as being least damaging from an economic perspective (apart from no Brexit) for the UK. Such an approach, however, is at odds with Theresa May's insistence on no permanent customs union with the EU (as this would limit the UK's ability to negotiate trade deals with other countries), along with ending the free movement of people. Only hard-line Brexiteers appear keen for the UK to leave the EU with no deal given the dire economic projections, however, risk remains that we reach a 'no-deal' outcome by accident, being unable to agree on anything else. An extension of Article 50 to allow further negotiations (even if the EU insists there is nothing more that can be done) may offer some hope. The outcome is far from clear: May's deal, a softer Brexit, hard Brexit, no Brexit, a second referendum, a general election (would either of the two main parties campaign for a second referendum – they suggest not).

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Investment Objective

The aim of the Fund is to provide high income.

Investment Policy

The Fund invests primarily in a diversified portfolio of high yield bonds issued by US companies where the period for full repayment of the bond by the company is expected to be less than 3 years. The fund manager seeks to reduce the effect of credit risk through diversification and its analysis and selection of investments.

The Fund aims to reduce the risk of movements in exchange rates between US Dollars and Sterling through the use of derivatives (financial instruments which derive their value from the value of other assets). The Fund may also use derivatives in an attempt to reduce the overall risks of its investments, reduce the costs of investing or generate additional capital or income (known as Efficient Portfolio Management - EPM).

Risk and Reward Profile

As at 31 December 2018 (unaudited)

By investing in a Fund which invests primarily in fixed interest stocks you are likely to be looking for an investment which will generate an income but had less potential for capital return than is the case with funds which invest primarily in equities. You are willing to accept that your investment will fall and rise in value and that you could get back less than you invest. You are aware that investing in a Fund which has a US remit can increase risk because of currency movements in return for greater potential reward. You are also aware that investing in sub investment grade bonds may increase the potential income but also increases risk to your investment. Typically you would be investing for a period of at least five years.

| Lower Risk | | | | Higher Ris | | |
|----------------------|------|---|---|------------|-------|-----------------------|
| Potentially lower re | ward | | | | Poter | ntially higher reward |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |

The risk category is calculated using historical performance data and may not be a reliable indicator of the Fund's future risk profile. The risk category shown is not guaranteed and may shift over time. The lowest category does not mean risk free.

Why is this Fund in this category?

The capital of the Fund is not guaranteed. The Fund is invested in financial markets and uses techniques and instruments which are subject to some level of variation which may result in gains or losses.

Additional risks

Under normal market conditions the Fund's key risk factors are:

• Credit risk - all bonds have a potential credit risk, in that the issuer could default on its obligations to pay income and/or capital. An issuer default would likely result in a large drop in the value of that bond. The value of a bond will also be affected by the perceived credit risk of the issuer, including changes to credit ratings and the general level of aversion to credit risk in the market. Generally, an increased level of perceived credit risk leads to a fall in the value of the bond, and vice versa. Credit risk can be measured by ratings assigned to issuers of bonds by third party credit rating agencies. The largest credit rating agencies are Moody's, Standard & Poor's and Fitch Ratings. Each credit rating agency uses different designations. The highest designation (Aaa (Moody's), AAA (Standard & Poor's and Fitch Ratings)) are intended to represent a lower probability of default of the issuer. The credit rating agencies designate "investment grade" bonds as Baa3 or above (Moody's) or BBB- or above (Standard & Poor's or Fitch Ratings). See further below under "High yield bonds risk".

Internal investment guidelines are set, if necessary, to ensure credit risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy. These guidelines could include credit quality indicators, measures of sensitivity to credit spread moves and diversification measures.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

• High Yield Bonds risk - high yield bonds (also known as sub-investment grade bonds) are fixed interest securities issued by companies or governments with lower credit ratings (Ba1 and below (Moody's) or BB+ and below (Standard & Poor's and Fitch Ratings)). They are potentially more risky than investment grade bonds which have higher ratings. The issuers of high yield bonds will be at greater risk of default or ratings downgrades. The capital value of a Fund's investment in high yield bonds and the level of income it receives may fall as a result of such issuers ceasing to trade. A Fund will endeavour to mitigate the risks associated with high yield bonds, by diversifying their holdings by issuer, industry and credit quality.

This is an inherent risk for funds invested within high yield bonds. Internal investment guidelines (which may include measures of credit quality, measures of sensitivity to credit spread moves and diversification measures), scenario testing as well as other regular monitoring seek to ensure the level of risk is aligned with each individual fund's investment objectives and investment policy.

• Interest Rate risk - is the risk that the market value of bonds held by the Fund could fall as a result of higher market rates (yields). Yields can change as a result of, among other things, the economic and inflation outlook which also affects supply and demand as well as future interest rate expectations, without necessarily a change in official central bank short term interest rates. Higher yields result in a decline in the value of bonds. Conversely, lower yields tend to increase the value of bonds. Duration (a measure based on the coupon and maturity payments schedule of a bond) is an important concept in understanding how the price of that bond might change for a 1% move in its redemption yield. A bond with a longer duration is more sensitive to a change in yields and, generally speaking, will experience more volatility in its market value than bonds with shorter durations.

Internal investment guidelines are set if necessary to ensure interest rate risk is maintained within a range deemed suitable based on the individual Fund's investment objectives and investment policy. These guidelines could include measures of sensitivity to changes of interest rates.

• Prepayment and extension risk - prepayment risk is the risk associated with the early unscheduled return of capital (i.e., repayment of the debt) by the issuer on a bond. Prepayment generally occurs in a declining interest rate environment. When capital is returned early, no future interest payments will be paid on that part of the capital. If the bond was purchased at a premium (i.e., at a price greater than the value of the capital), the return on the bond will be less than what was estimated at the time of purchase.

The opposite of prepayment risk is extension risk which is the risk of a bond's expected maturity lengthening in duration due to a slowdown in prepayments of capital. Extension risk is mainly the result of rising interest rates. If the bond was purchased in anticipation of an early repayment of capital, an extension of the maturity could impact the price of the bond. The portfolio tends to hold a mixture of callable and non-callable positions.

Other risks which could have an impact in extreme market conditions include:

• Liquidity risk - under certain market conditions, it may be difficult to buy or sell investments for the Fund. For example, corporate and emerging market bonds may be affected by the demand in the market for such bonds carrying credit risk, particularly in times of significant market stress. As a result, it may not be possible to buy or sell such investments at a preferred time, close to the last market price quoted or in the volume desired. The ACD may be forced to buy or sell such investments as a consequence of Shareholders buying or selling Shares in the Fund. Depending on market conditions at the time, this could lead to a significant drop in the Fund's value.

Regular monitoring is conducted to ensure a high degree of confidence that Fund liquidity will meet the Fund's expected liquidity requirements.

• Counterparty risk - at any one time, a Fund may be exposed to the creditworthiness and stability of the counterparties to transactions entered into by the Fund (including derivative and stock lending and repo/reverse repo transactions). The Fund will be subject to the risk of the inability of its counterparties to perform its obligations under such transactions (default), whether due to insolvency, bankruptcy or other causes. In the event of the insolvency of a counterparty, the Fund might not be able to recover cash or assets of equivalent value, to that invested, in full. The Fund may receive assets or cash from the counterparty (collateral) to protect against any such adverse effect. Where relevant, a counterparty will forfeit its collateral if it defaults on the transaction with the Fund. However, if the collateral is in the form of securities, there is a risk that when it is sold, it will realise insufficient cash to settle the counterparty's debt to the Fund under a transaction or to purchase replacement securities that were lent to the counterparty under a stock lending arrangement. In relation to stock lending arrangements, there is also the risk that while cash is recovered in the event of a default, the actual stock cannot be repurchased. Furthermore, to the extent that collateral is not present to cover part or all of the debt, a counterparty default may result in losses for the affected Fund. To assist in managing these types of risks, the ACD sets criteria around the types of eligible collateral a Fund may accept. Please see the paragraph entitled "Treatment of Collateral" in the "Investment and borrowing powers applicable to the Funds" section in Appendix II of the Prospectus for more information.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

Transactions in securities that the Fund may enter into expose it to the risk that the counterparty will not deliver the investment for a purchase or cash for a sale after the Fund has contracted to fulfil its responsibilities. This is minimised by the practice in the majority of markets of delivery versus payment and short settlement periods.

• Currency risk (Note that the Fund aims to reduce the risk of movements in exchange rates by hedging the foreign currency exposure of the Fund back to pounds sterling.) - assets of a Fund (including cash), and any income paid on those assets, may be denominated in a currency other than the base currency of the Fund. Changes in the exchange rate between the base currency and the currency of an asset may cause the value of the asset/income (expressed in the base currency) to fall as well as rise even if there is no change of the value of such assets in its local currency. This may also cause additional volatility in the Fund's Price. It may not be possible or practicable to hedge against such exchange rate risk.

The ACD aims to reduce the risk of movements in exchange rates on the value of all or part of the assets of a Fund through the use of currency exchange transactions. A Fund may enter into currency exchange transactions either on a spot basis (i.e., exchanging at the current price) or through forward currency transactions (i.e., agreeing to purchase the currency at an agreed price at a future date). Neither spot transactions nor forward currency transactions will completely eliminate fluctuations in the prices of a Fund's securities or in foreign exchange rates, or prevent loss if the prices of these securities should decline. The performance of a Fund may be strongly influenced by movements in foreign exchange rates because currency positions held by a Fund may not correspond with the securities positions held.

Although these transactions are intended to minimise the risk of loss due to a decline in the value of the hedged currency, they also limit any potential gain that might be realised should the value of the hedged currency increase. Forward currency transactions may also have the effect of reducing or enhancing a Fund's performance due to the difference between the exchange rate available on such transactions compared to the current (spot) exchange rate. Under normal market conditions this difference in exchange rates is mainly caused by the different short term interest rates applicable to the currency of the assets and the base currency of the Fund. Where the interest rate applying to the foreign currency is higher than that of the Fund's base currency, this can reduce the Fund's performance and vice-versa. This impact on performance is usually far less pronounced than the effect of fluctuations of exchange rates that the use of such transactions is intended to reduce, but the impact can be significant over time, particularly where there is a wide gap between the interest rates applicable to the two currencies. The precise matching of the relevant contract amounts and the value of the securities involved will not generally be possible because the future value of such securities will change as a consequence of market movements in the value of such securities between the date when the relevant contract is entered into and the date when it matures. Therefore, the successful execution of a hedging strategy which matches exactly the profile of the investments of any Fund cannot be assured. Furthermore, it may not be possible to hedge against generally anticipated exchange or interest rate fluctuations at a price sufficient to protect the Fund from the anticipated decline in value of its assets as a result of such fluctuations.

Internal investment guidelines are set, if necessary, to ensure currency risk is maintained within a range deemed suitable based on the individual fund's investment objectives and investment policy.

Investment Review

The high yield market posted a negative return in the six months to 31 December 2018. The ICE BofAML US High Yield Index generated a total return of -2.34% for the period. Positive returns in the third quarter (+2.44%) were offset by negative returns in the fourth quarter (-4.67%). Returns for the period were driven by rising interest rates, US-China trade tensions and concerns over the duration of the economic cycle. Flows into the high yield market were negative in the second half of 2018, with \$20.7 billion in outflows for the period. On a quarterly basis, outflows were \$0.5 billion in the third quarter, followed by outflows of \$20.2 billion in Q4. The high yield primary market priced \$61.1 billion of new issuance in the second half of 2018, down 60% from the \$152.4 billion priced during the same period in 2017. There was \$4.7 billion of high yield default volume during the period, lower than the \$7.2 billion of high yield default volume in the same period in 2017. The par-weighted high yield default rate at 31 December 2018 was 1.81%, down from 1.98% at the beginning of the period.

For the second half of 2018, high yield outperformed US equities (S&P 500, -6.86%) but underperformed US treasuries (+1.93%) and US investment grade corporates (+0.90%). Within US high yield, returns were driven by the higher end of the credit quality spectrum, as BB rated (-0.71%) and B rated (-2.56%) credit outperformed lower quality CCC and lower-rated (-7.80%) credits on a relative basis. From a sector perspective, two out of 18 industry sectors posted positive total returns for the period. On a relative basis, utilities (+0.52%), media (+0.30%) and healthcare (-0.32%) were the best-performing sectors, while energy (-7.66%), insurance (-3.11%) and retail (-2.99%) were the worst-performing sectors. During the second half of 2018, the ICE BofAML US High Yield Option-Adjusted Spread widened from 371 basis points (bps) at 30 June 2018 to 533bps at 31 December 2018, an increase of 162bps. The High Yield Index's yield-to-worst ended the period at 7.95%, compared to 6.53% at the start of the period. The High Yield Index's average price was \$92.31 at 31 December 2018, \$5.53 lower than the \$97.84 average price at the start of the period.

Investment Manager's Report

For the six months ended 31 December 2018 (unaudited)

AXA IM's US Short Duration High Yield Fund performed very well during the six-month period ending 31 December 2018, generating a modestly positive return (gross USD), despite a volatile and negative return (-2.34%) for the overall high yield market. Our up-in-quality positioning, the shorter duration nature of our holdings and our positioning and security selection within the energy sector all benefited performance and helped dampen volatility. During the second half of 2018, the yield-to-worst of the Fund (exclusive of cash) widened by 124bps to 6.21%, while the overall market yield widened by 142bps to 7.95%. The Option Adjusted Spread of the Fund widened by 127bps to 360bps. The overall Fund duration (using a calculation of modified duration-to-worst) increased from 2.0 to 2.5, while the market duration increased from 4.2 to 4.3.

Position count decreased during the second half of 2018, but the portfolio remains well diversified. We believe that diversification of portfolio holdings is important for the Fund and helps to manage credit risk. Our top holding at the year-end, a 1.6% position, was HRG Group. At 31 December 2018, approximately 62% of the portfolio was invested in securities in excess of three years, but which we expect to be redeemed early. This is down roughly 5% from 30 June as a large number of bonds rolled into the three-year maturity window during December; however, we still believe that the yield-to-call bonds are a better source of relative value. Market technicals were mixed during the second half of 2018 as flows were significantly negative, partially offset by substantially lower volumes of new issuance. Although primary market activity has been extremely light recently, we expect volumes to pick up in the new year once volatility subsides, and companies to opportunistically refinance debt maturing in excess of three years. Coupled with healthy corporate fundamentals, a benign default rate, and much more attractive valuations, the backdrop for the Short Duration Fund remains supportive.

Accounting Policies

For the six months ended 31 December 2018 (unaudited)

Accounting Basis

Basis of accounting

The Financial Statements of the Company comprise the Financial Statements of each of the sub-funds and have been prepared on a historical cost basis, as modified by the revaluation of investments, and in accordance with Financial Reporting Standard 102 ("FRS 102") and the Statement of Recommended Practice for Authorised Funds issued by the Investment Management Association ("IMA") in May 2014, and amended in June 2017. The Financial Statements have been prepared on a going concern basis. The Financial Statements are prepared in accordance with the Instrument of Incorporation and the Financial Conduct Authority's Collective Investment Schemes Sourcebook ("COLL").

The accounting policies applied are consistent with those of the annual Financial Statements for the year ended 30 June 2018 and are described in those Financial Statements.

Statement of the Authorised Corporate Director's ("ACD") Responsibilities

The Open-Ended Investment Companies Regulations 2001 and the Collective Investment Schemes sourcebook ("COLL") require the ACD to prepare financial statements for each annual accounting period which give a true and fair view of the financial position of the Company and of its net revenue and the net capital gains/(losses) on the property of the Company for the period. In preparing the financial statements the ACD is required to:

· Select suitable accounting policies and then apply them consistently;

• Conform with the disclosure requirements of the Statement of Recommended Practice - Financial statements of UK Authorised Funds issued by the Investment Management Association ("IMA SORP 2014") in May 2014:

· Follow generally accepted accounting principles and applicable accounting standards;

• Keep proper accounting records which enable it to demonstrate that the financial statements as prepared comply with the above requirements.

• Prepare the financial statements on the going concern basis unless it is inappropriate to presume that the Company will continue in operation.

The ACD is responsible for the management of each portfolio in accordance with the Instrument of Incorporation, Prospectus and COLL.

The ACD is also responsible for taking reasonable steps for the prevention and detection of fraud and other irregularities.

The maintenance and integrity of the AXA Investment Managers UK Limited website is the responsibility of the directors; the work carried out by the auditors does not involve consideration of these matters and, accordingly, the auditors accept no responsibility for any changes that may have occurred to the financial statements since they were initially presented on the website.

Legislation in the United Kingdom governing the preparation and dissemination of financial statements may differ from legislation in other jurisdictions.

Directors approval

In accordance with the requirements of the Financial Conduct Authority Sourcebook, the contents of this report have been approved on behalf of AXA Investment Managers UK Limited by:

Philippe L Barrois d'O deval Director 27th February 2019

John Stainsb

Further Information

Classes of Shares

The Company can issue different classes of shares in respect of any Fund. Holders of Income shares are entitled to be paid the revenue attributable to such shares, in respect of each annual or accounting period. Holders of Accumulation shares are not entitled to be paid the revenue attributable to such shares, but that revenue is retained and accumulated for the benefit of shareholders and is reflected in the price of shares.

Valuation Point

All investments are valued at their fair value price as at 4:30pm on 31 December 2018 being the last business day of the accounting period (with the exception of Global High Income Fund & US Short Duration High Yield Fund which are valued at midday). The fair value for non-derivative securities is bid price. Other investments have been stated at the Manager's valuation and this has been indicated in the portfolio statements.

Other Information

The Instrument of Incorporation, Prospectus and the most recent and annual reports may be inspected at the office of the ACD which is also the Head Office of the Company and copies may be obtained upon application. Shareholders who have any complaints about the operation of the Company should contact the ACD or the Depositary in the first instance. In the event that a shareholder finds the response unsatisfactory they may make their complaint direct to the Financial Ombudsman Service at Exchange Tower, London E14 9SR.

Report

The annual report of the Company will be published within four months of each annual accounting period and the report will be published within two months of each accounting period.

| Interim accounts | period ended 31 December |
|------------------|--------------------------|
| Annual accounts | year ended 30 June |

Data Protection

The details you have provided will be held on computer by the Funds' Registrar but will not be used for any purpose except to fulfil its obligations to shareholders.

Effects of Personal Taxation

Investors should be aware that unless their shares are held within an ISA, or switched between Funds in this OEIC, selling shares is treated as a disposal for the purpose of Capital Gains tax.

Risk Warning

An investment in an Open Ended Investment Company should be regarded as a medium to long term investment. Investors should be aware that the price of shares and the income from them may fall as well as rise and investors may not receive back the full amount invested. Past performance is not a guide to future performance. Investments denominated in currencies other than the base currency of a fund are subject to fluctuation in exchange rates, which may be favourable or unfavourable.

The Securities Financing Transactions Regulation

The Securities Financing Transactions Regulation, as published by the European Securities and Markets Authority, aims to improve the ansparency of the securities financing markets.Disclosures regarding exposure to Securities Financing Transactions (SFTs) or total return swaps required on all reports & accounts published after 13 January 2017. During the period to 31 December 2018 and at the balance sheet date, the Company did not use SFTs or total return swaps, as such no disclosure is required.

Further Information
