Fund Manager commentary

Asian stock markets fell in US dollar terms as the US currency continued to strengthen against regional currencies.

Chinese shares rose as the authorities vowed further stimulus measures to bolster the economy, although an unexpected slowdown in annual inflation in November increased worries about deflation.

Indian equities declined as investors fretted about elevated valuations and hawkish comments from the US Federal Reserve (Fed).

In Taiwan, the strength in the technology sector continued to drive the wider market higher. South Korean equities fell sharply as President Yoon Suk Yeol's short-lived attempt to impose martial law sparked a political crisis.

Australian stock markets also retreated, with the Australian dollar weakening against both sterling and the US dollar as third-quarter gross domestic product (GDP) growth of 0.3% fell short of expectations. The economy's performance fuelled investor speculation that the Reserve Bank of Australia will ease borrowing conditions in 2025.

The financial sector was particularly strong as Chinese financials performed well after the authorities signalled a more dovish monetary policy stance. Conversely, materials lagged due to the weakness in Australian mining companies.

Portfolio review

The holdings in Australian financials, ANZ and Macquarie, detracted from performance. Shares in these stocks weakened following a broad-based sell-off in the Australian stock market amid concerns over higher interest rates and slowing economic activity.

Conversely, the leading positive contributors were Brilliance China Automotive and state-owned China Construction Bank. The share price of Brilliance China, the manufacturer of BMW vehicles in China, rose after the company approved a revised dividend policy that fuelled speculation of a higher dividend pay-out in the future. Shares in China Construction Bank rose along with shares in other Chinese financial firms, following a policy shift to adopt looser monetary policy in order to further stabilise the country's stock and property markets.

During the month, we exited the position in Samsonite International.

Manager outlook

While the challenges faced by China have been dominating headlines, we think there are numerous bright spots in the region. India, Indonesia, Taiwan and South Korea provide strong exposure to regional growth themes. Companies in these countries are also demonstrating evidence of dividend growth with areas such as Indonesian banks, firms exposed to South Korean corporate reform and Taiwanese technology firms providing high and growing dividends. If the recent stimulus measures in China manage to spur industrial and consumption activity, then we think this, along with any interest rate cuts in the first half of 2025, may provide a further boost to Asian markets. The economic growth differential between Asia and the rest of the world remains wide and valuations continue to be attractive in our view. As a result, we are observing significant opportunities to accumulate quality companies that are growing their earnings and increasing their dividends across many of our markets. The outlook for dividends in the region remains robust as positive free cash flow generation alongside the strength of balance sheets – with record cash being held by corporates – provide a strong backdrop across a number of sectors and markets across the region.

Glossary

Discount/Premium

The amount by which the price per share of an investment company is either lower (at a discount) or higher (at a premium) than the net asset value per share (cum income), expressed as a percentage of the net asset value per share.

Gearing

The effect of borrowing money for investment purposes (financial gearing). The amount a company can "gear" is the amount it can borrow in order to invest. Gearing is used in the expectation that the returns on the investments bought will exceed the costs of the borrowings that funded the purchase. This Company can also use synthetic gearing through derivatives and foreign exchange hedging and/or other non-fully funded instruments or techniques.

Leverage

The Company's leverage is the sum of financial gearing and synthetic gearing. Details of the Company's leverage limits can be found in both the Key Information Document and Annual Report. Where a company utilises leverage, the profits and losses incurred by the company can be greater than those of a company that does not use leverage.

Market capitalisation

Share price multiplied by the number of shares in issue, excluding treasury shares, at month end. Shares typically priced mid-market at month-end closing.

Net Asset Value (NAV)

The total value of a Company's assets less its liabilities.

NAV (Cum Income)

The value of investments and cash, including current year revenue, less liabilities (prior charges such as loans, debenture stock and preference shares at fair value).

NAV (Ex Income)

The value of investments and cash, excluding current year revenue, less liabilities (prior charges such as loans, debenture stock and preference shares at fair value).

NAV total return

The theoretical total return on shareholders' funds per share reflecting the change in Net Asset Value (NAV) assuming that dividends paid to shareholders were reinvested at NAV at the time the shares were quoted ex-dividend. A way of measuring investment management performance of investment trusts which is not affected by movements in discounts/premiums.

Net assets

Total assets minus any liabilities such as bank loans or creditors.

Net cash

A company's net exposure to cash/cash equivalents expressed as a percentage of shareholders' funds, after any offset against its gearing. This is only shown for companies that have gearing in place.

Net gearing

A company's total assets (less cash/cash equivalents) divided by shareholders' funds expressed as a percentage.

Ongoing charges

The total expenses for the financial year (excluding performance fee), divided by the average daily net assets, multiplied by 100.

Share price

Closing mid-market share price at month end.

Share price total return

The theoretical total return to the investor assuming that all dividends received were reinvested in the shares of the company at the time the shares were quoted ex-dividend. Transaction costs are not taken into account.

Total assets

Cum Income NAV multiplied by the number of shares, plus prior charges at fair value.

Yield

Calculated by dividing the current financial year's dividends per share (this will include prospective dividends) by the current price per share, then multiplying by 100 to arrive at a percentage figure.

Source for fund ratings/awards

Overall Morningstar Rating[™] is shown for an investment company achieving a rating of 4 or 5.

Company specific risks

- This Company is suitable to be used as one component of several within a diversified investment portfolio. Investors should consider carefully the proportion of their portfolio invested in this Company.
- Active management techniques that have worked well in normal market conditions could prove ineffective or negative for performance at other times.
- The Company could lose money if a counterparty with which it trades becomes unwilling or unable to meet its obligations to the Company.
- Shares can lose value rapidly, and typically involve higher risks than bonds or money market instruments. The value of your investment may fall as a result.
- The return on your investment is directly related to the prevailing market price of the Company's shares, which will trade at a varying discount (or premium) relative to the value of the underlying assets of the Company. As a result, losses (or gains) may be higher or lower than those of the Company's assets.
- If a Company's portfolio is concentrated towards a particular country or geographical region, the investment carries greater risk than a portfolio that is diversified across more countries.
- The Company has significant exposure to Emerging Markets, which tend to be less stable than more established markets. These markets can be affected by local political and economic conditions as well as variances in the reliability of trading systems, buying and selling practices, and financial reporting standards.
- The portfolio allows the manager to use options for efficient portfolio management. Options can be volatile and may result in a capital loss.
- Where the Company invests in assets that are denominated in currencies other than the base currency, the currency exchange rate movements may cause the value of investments to fall as well as rise.
- The Company may use gearing (borrowing to invest) as part of its investment strategy. If the Company utilises its ability to gear, the profits and losses incurred by the Company can be greater than those of a Company that does not use gearing.
- All or part of the Company's management fee is taken from its capital. While this allows more income to be paid, it may also restrict capital growth or even result in capital erosion over time.

Not for onward distribution. Before investing in an investment trust referred to in this document, you should satisfy yourself as to its suitability and the risks involved, you may wish to consult a financial adviser. This is a marketing communication. Please refer to the AIFMD Disclosure document and Annual Report of the AIF before making any final investment decisions. Past performance does not predict future returns. The value of an investment and the income from it can fall as well as rise and you may not get back the amount originally invested.
